

INTERNATIONAL STANDARDS FOR ANTIBIOTICS ORIGIN OF GOODS

Erythromycin

International Standards for Antibiotics (ISAs) are primary standards intended to establish national/regional secondary standards. ISAs should not be used as working standards in routine assays as they are produced in a limited quantity. Existing well-established secondary standards, which fulfil your requirements (activities/potencies expressed in IUs, etc...) such as regional, national or in house standards, should be used as working standards.

Purpose of Material: this shipment contains drug samples for investigational use only and is intended for laboratory testing only.

NOT FOR FOOD

NOT FOR HUMAN CONSUMPTION

FOR LABORATORY USE ONLY

I give you the origin for the following substance:

| Code catalogue | Batch number | Origin |
|----------------|--------------|---|
| ISA_65774 | 3 | Microbiological process: (<i>Saccharopolyspora erythraea</i>) |

- The material is not of animal origin;
- The material does not come from a facility where work with exotic viruses affecting livestock and avian species is conducted;
- The material does not produce antigens or contain genes of livestock or avian disease agents or does not produce monoclonal antibodies directed against livestock or avian disease agents;
- The preparation does not contain any animal derived additives, such as albumin.

Best regards,

Dr. Fanny MOUTIER-GAME
Head of Dispatching Section
Division of Reference Standards and Samples
