

## **INTERNATIONAL STANDARDS FOR ANTIBIOTICS ORIGIN OF GOODS**

### Second International Standard for Erythromycin

International Standards for Antibiotics (ISAs) are primary standards intended to establish national/regional secondary standards. ISAs should not be used as working standards in routine assays as they are produced in a limited quantity. Existing well-established secondary standards, which fulfil your requirements (activities/potencies expressed in IUs, etc...) such as regional, national or in house standards, should be used as working standards.

**Purpose of Material: this shipment contains drug samples for investigational use only and is intended solely for laboratory testing in vitro.**

**NOT FOR FOOD**

**NOT FOR HUMAN CONSUMPTION**

**FOR LABORATORY USE ONLY**

I give you the origin for the following substance:

<b>Code catalogue</b>	<b>Batch number</b>	<b>Origin</b>
ISA_76_538	2.0	Fermentation/Microbiological

- The material is not of animal origin;
- The material is for in vitro use only;
- The material does not come from a facility where work with exotic viruses affecting livestock and avian species is conducted;
- The material does not produce antigens or contain genes of livestock or avian disease agents or does not produce monoclonal antibodies directed against livestock or avian disease agents;
- The above materials do not contain any animal or cell culture derived products or additives such as albumin or serum.

Best regards,

**Dr. Fanny MOUTIER-GAME**
